

SELF-CHECK 1

A. Identification

- Frames 1. All visual animation media uses _____ a series of still images shown very rapidly to simulate motion or change.
- Animation 2. It is a visual technique that provides the illusion of motion by displaying a collection of images in rapid sequence
- Character Animation 3. It is an animation focused on the display of expressions, emotions and behaviors normally associated with intelligent life forms.
- Keyframe Animation 4. It is a technique for producing animations whereby important positions, sizes and orientations of objects at particular points in time are identified and everything else in-between is filled in by interpolation.
- 24 5. In animation it uses _____ frames per second.

B. Create a timeline for significant development in animation.

C. Site at least 3 examples of the following

- Computer games
 - * Minecraft
 - * Call of Duty
 - * Mobile Legends
- Internet:
 - * Animated Website Banners
 - * GIF
 - * Online interactive animations
- Advertising:
 - * TV commercials
 - * Animated Product Logos
 - * Social Media Animated ads
- Science:
 - * DNA models
 - * Solar System Simulation
 - * Weather Forecasting Animation
- Military simulation:
 - * Flight Simulations
 - * Combat training Simulations
 - * War Strategy Simulations
- Transport:
 - * Driving Simulations
 - * Flight Navigation Systems
 - * Traffic Flow Simulations

D. Do the following:

1. Find a story that migrated from a less visual medium (like a book or play) to animation. Compare the story in both mediums. How did it change?

"THE LITTLE PRINCE"

The Little Prince was originally written as a book and later adapted into animated film. In the book, the story depended heavily on imagination and symbolism, allowing readers to reflect deeply on its theme about life, love, and human relationships. In the animated version, the use of visuals, colors, music, and voice acting helped express emotions more clearly and made the story more accessible, especially for younger viewers. Some parts were simplified or expanded, but the main message of the story remained the same while becoming more engaging through animation.

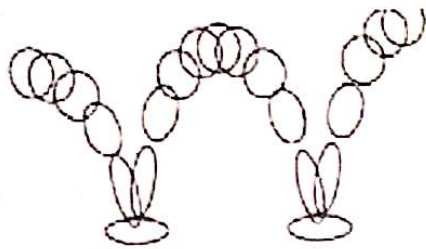

2. What do you think the animation industry will be like in twenty years? In fifty? What influences might change it? Discuss.

In 20 years, the animation industry will likely use more AI and advance tools to make animation faster and more accessible. Virtual and Augmented reality may also become more common, making animated content more interactive.

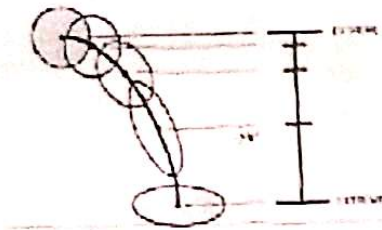

In 50 years, animation could be fully immersive and almost realistic, allowing audience to interact with stories in realtime. These changes will be influenced by technology, audience preference, and continuous innovation in digital media.

ACTIVITY 1

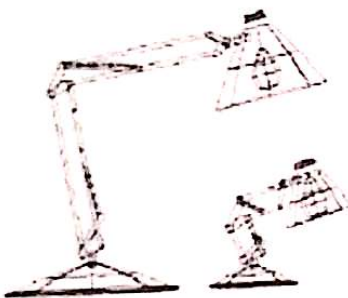

A. Identify the animation principle used in the following example

1. Squash and Stretch

2. Timing and Spacing

3. Anticipation

4. Follow Through and Overlapping Action

B. Illustrate the following and tell the animation principle used

1. In the medium shot on the left Mister Moonface looks sad, however the long shot on the right places him in an isolated location, emphasising his loneliness and sadness

Staging is used to clearly present the idea or emotions to the audience. The medium shot focuses on Mr. Moonface's sad expression, while the longshot emphasizes loneliness.

2. Mister Moonface's cape billows out behind him as he walks. When he comes to an abrupt halt, the cape continues moving forwards, wrapping around him, before falling into its natural position.

Appeal helps clearly define characters' personalities through design, making look either friendly and other one is villainous in one look.

3. Mister Moonface's next door neighbour is Mister Midnight. While Mister Moonface is a happy and fun character, Mister Midnight is nasty and scheming.

The cape continues to move even after the body stops, showing realistic motion and fluidity.

4. Mister Moonface is startled by a spider.

His facial expression is exaggerated, and Mister Moonface's reaction is exaggerated even further, to the extent that he actually jumps off the floor.

Exaggeration makes action and emotion stronger and more entertaining by pushing them beyond realistic limits.

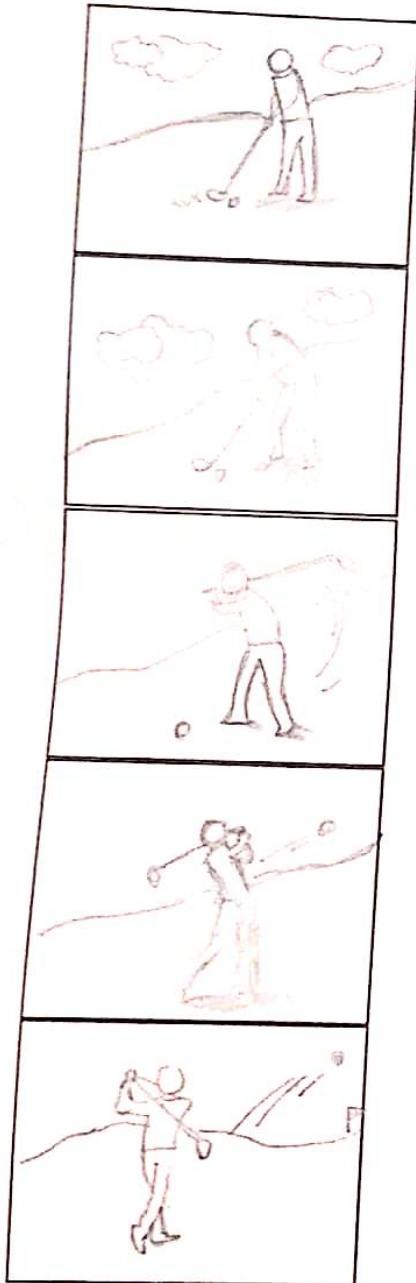

INFORMATION SHEET 3 ANIMATION PROCESS

A. Visit an animation studio. Diagram the animation production pipeline. Discuss in class.

B. Creating a storyboard.

Create a conceptual thumbnail about a man playing golf.

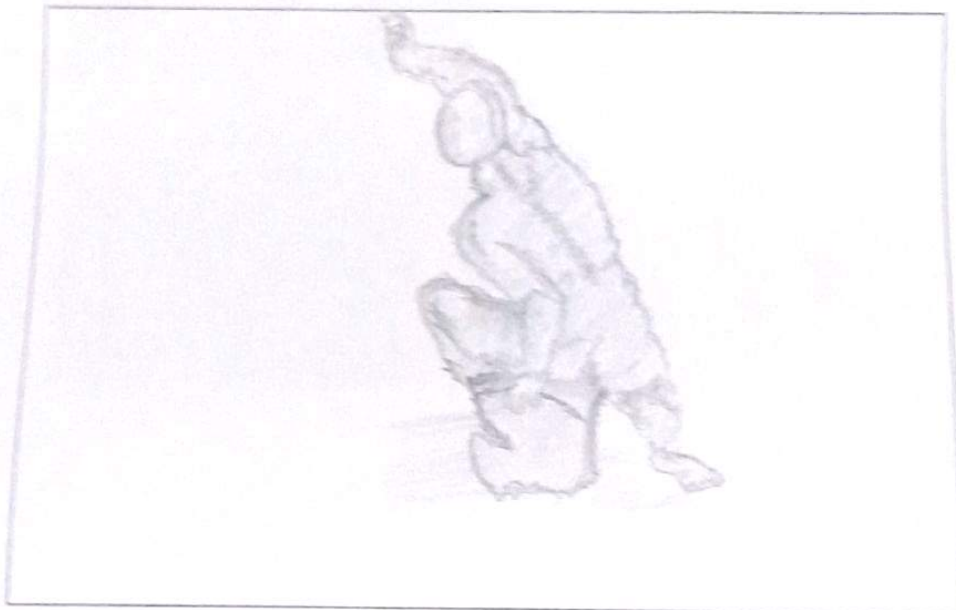

MABINI COLLEGES, INC.
Daet, Camarines Norte

COLLEGE OF COMPUTER STUDIES
1st Sem., S.Y.2020-2021

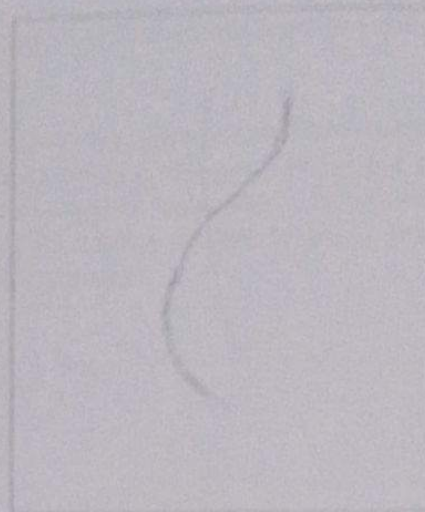

A. Draw the illustration below. (No tracing please)

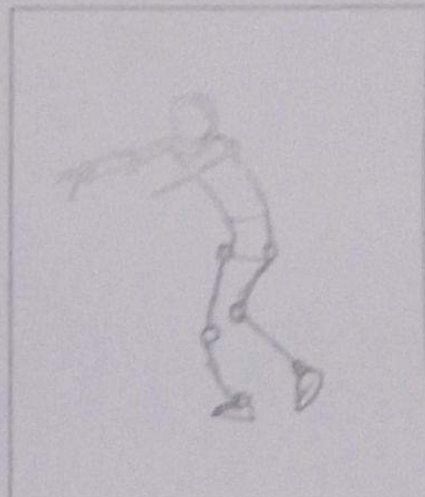

B. Creating gesture drawing

1. Hatch out a line similar to the spinal curve and start there.

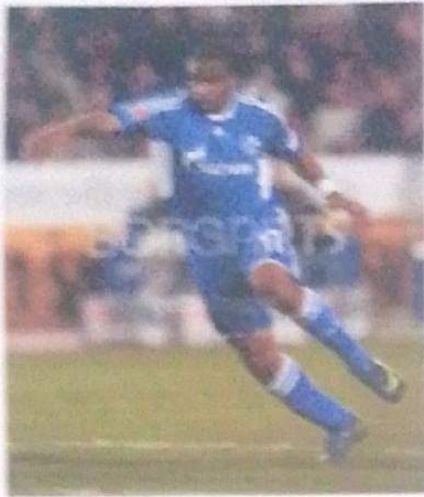

2. Look at the position of the shoulders and how the arms extend outwards. They also form dynamic action lines. Now, note the position of the hips, and how the legs extend from the pelvis. Again, more dynamic line work. At this stage you should be creating a stick man skeleton.

3. This is the foundation of your gesture drawing. Once that is complete, block in the head and neck, followed by the upper torso and pelvis. Do not make the upper body one piece, otherwise you will make your form look more like a barrel than a person. Take a quick second and think about your own anatomy. Your rib cage isn't fused to your pelvis like a tin can – you have your

spinal column to provide the anchor, and your pelvis acts as a pivot point. Therefore, they should be drawn separately.

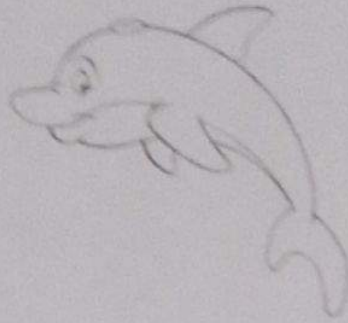

Keep the drawing loose and simple – you can refine these details later. Your next step should be to create the forms of the legs and feet and all the joints in between – knees and ankles. Now, your drawing should look more like a wooden mannequin. Remember – NO ERASING. Just draw. There's no style points in a gesture drawing. You're training yourself to create forms quickly and build a better response between your eye, brain and hand.

SELF-CHECK 5

ACTIVITY 1. LET'S DRAW USING BASIC SHAPES

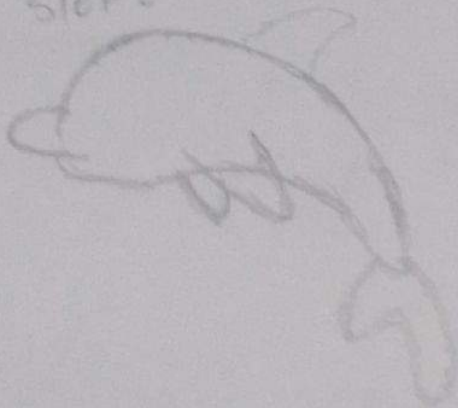

Using the steps above, draw a Dolphin with the final image below

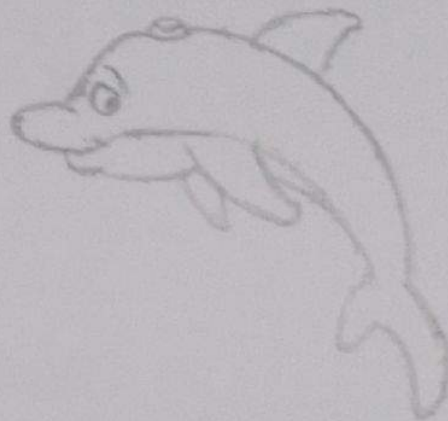

STEP 1

STEP 2

STEP 3

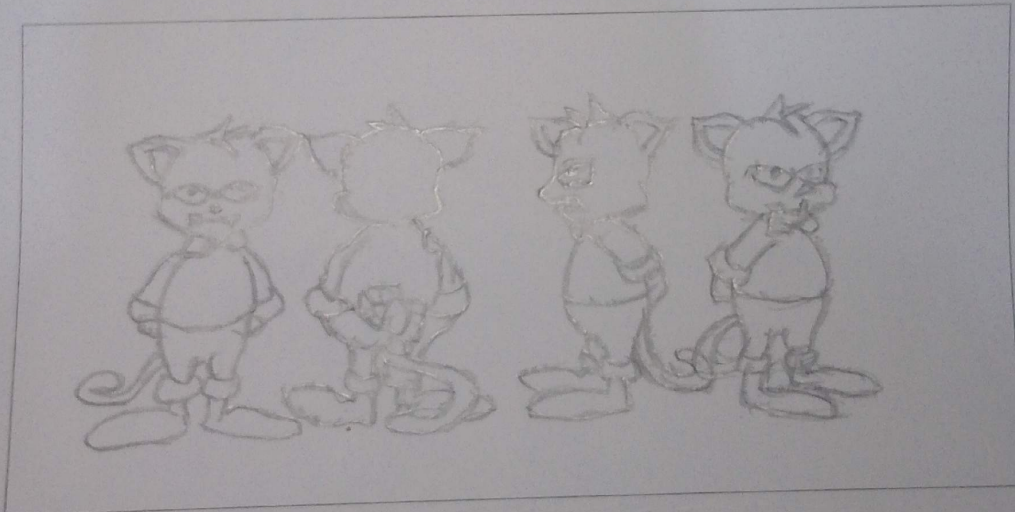

5.3 MODEL SHEETS

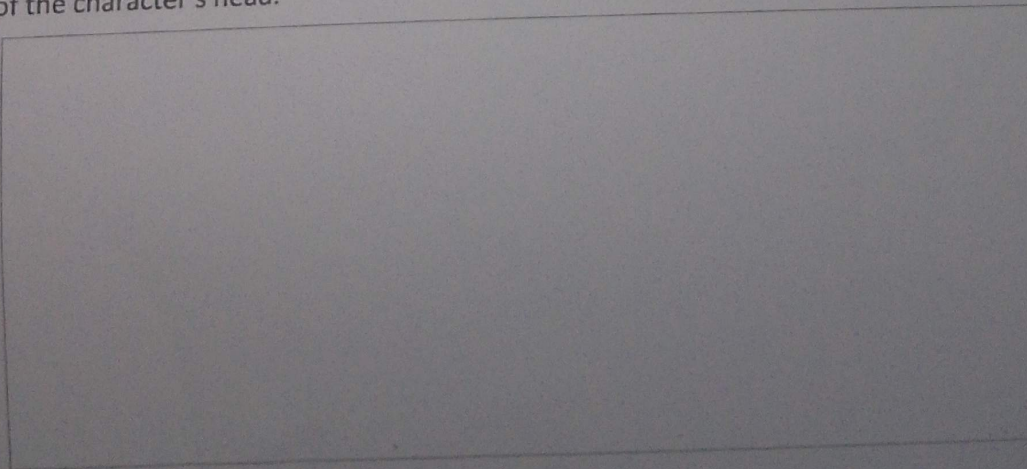

Focus Questions
Thinking to Learning Thoroughly

SELF-CHECK 5

1. Redraw the sample model sheet below.

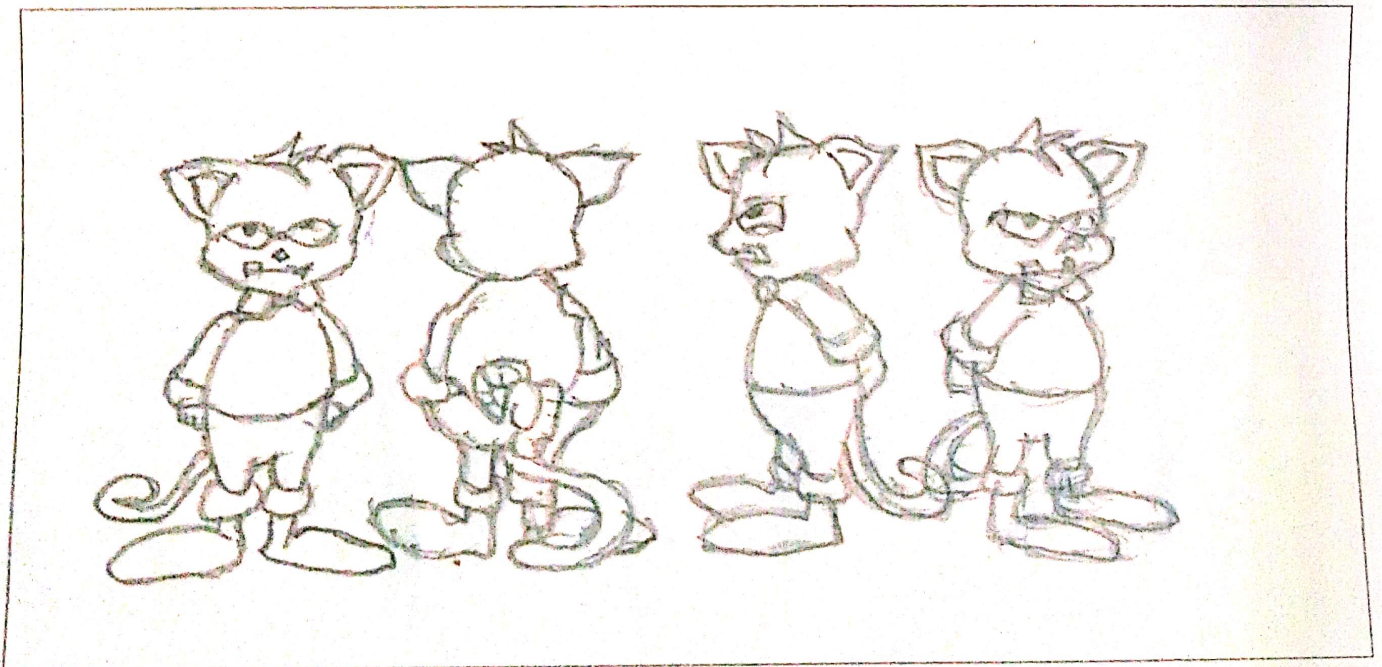

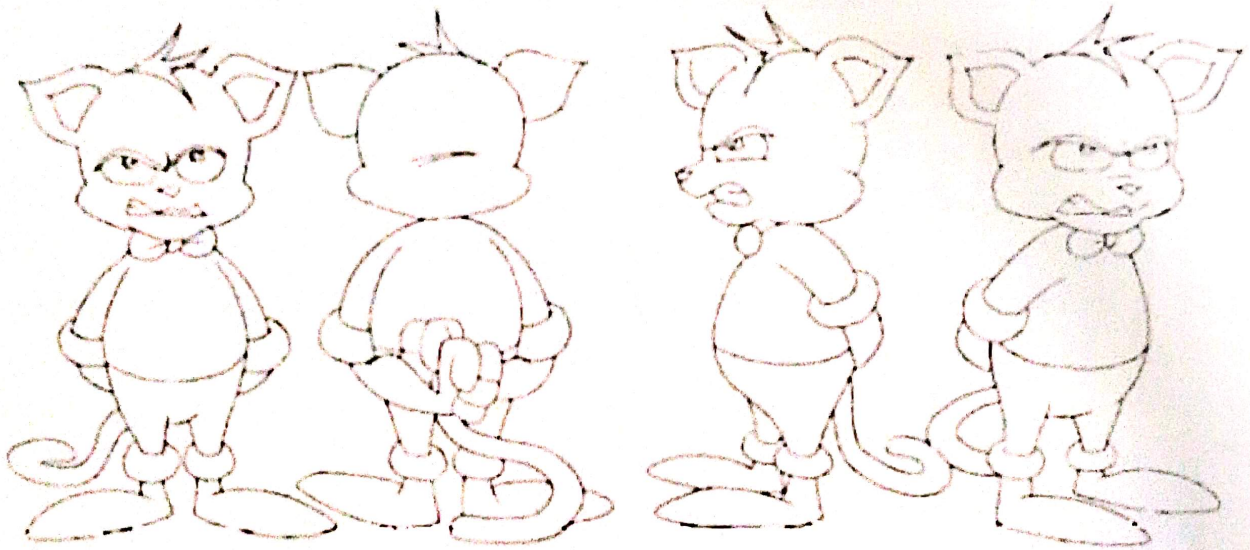

2. The next page of the **model sheet** involves a close-up with the details, proportions and structure of the character's head.

Focus Questions
Thinking to Learning Thoroughly

SELF-CHECK 5

1. Redraw the sample model sheet below.

2. The next page of the **model sheet** involves a close-up with the details, proportions and structure of the character's head.

SELF-CHECK 6

A. Identification.

Key Frames 1. It is used to describe those critical positions of an animated character or an object which depict the extreme points in its path of motion, or accents in its expression or mood.

Pose to Pose Animation 2. This method allows the animator to map out the action in advance with 'sign posts' by charting up these key poses onto 'exposure sheets' or 'dope sheets', or indeed into the timeline of computer software.

Story/Storyline 3. Obviously when planning a set of key poses for a shot or scene, the animator needs to be acutely aware of the requirements of the ___ and the particular actions and events that are necessary to progress the storyline.

Key Poses 4. Key poses describe WHAT happens, but not necessarily HOW it happens. True or False

Dynamic Poses 5. Poses should have both _____ - depicting the physical extreme of an action or setting up the character for an action to follow by loading its 'muscles', and _____ - an expressive pose with a dynamic quality that implies what has gone before, what is about to come, and which registers and emphasizes the inner emotional state of the character.
